

Dustin Brinkman

Full Stack Engineer

(719) 502-9585 | mimirs.spring@gmail.com | github.com/SonicBlissed | linkedin.com/in/dustin-brinkman

PROFESSIONAL SUMMARY

Full Stack Engineer with 7+ years building scalable single-page applications with React, TypeScript, and Redux, backed by Node.js services, relational and document databases, and cloud-hosted infrastructure. Ships complete products end to end — front end, API and authentication, database, and deployment — including independently designed and launched web, mobile, and automation products. Focused on secure architecture (including zero-knowledge credential storage), reusable component design, code quality, and using AI tooling to build and maintain products efficiently.

SKILLS

Languages: JavaScript (ES5 / ES6 / ESNext), TypeScript, Python, SQL, Dart

Front End: ReactJS, Redux, redux-thunk, React Native, Next.js, Vue 3, Quasar, HTML5, CSS3, SASS, LESS, Bootstrap, Material UI, Axios, AJAX/JSON, Component-driven & Responsive UI, Micro-frontend Architecture

Back End: Node.js, RESTful API design & integration, WebSockets, authentication & authorization

Databases: PostgreSQL (Supabase), MongoDB, SQL Server, MySQL

Mobile & Game Dev: React Native, Flutter, Flame engine

Cloud & DevOps: Supabase (Auth, Postgres, hosting), Fly.io, Netlify, cloud service/bot hosting, Webpack, Babel, Vite, Git, GitHub

Testing: Jest, React Testing Library, Cypress

AI: Building and maintaining production products with AI/LLM tooling and AI-assisted development workflows

Methodologies: Agile, SDLC, Git-based workflows, code review

SELECTED PROJECTS

Independently designed, built, and deployed full-stack products end to end. Several core repositories are kept private to protect live products; additional automation and productivity work is on GitHub.

SmurfManager — Full-Stack Web Application

smurfmanager.com

- Designed and built a full-stack web app that lets gamers consolidate multiple gaming accounts, credentials, and per-account stats into a single dashboard for at-a-glance access.
- Implemented authentication with Supabase Auth and a zero-knowledge architecture so stored credentials remain encrypted — a database breach would not expose user information.
- Built the React/TypeScript front end, designed the data model and Supabase (PostgreSQL) backend, and integrated external stat sources over REST.

SOL Bot v2 — Automation System & Full-Stack Dashboard

sol-bot-v2.netlify.app

- Built an end-to-end automation system: a Python bot that autonomously plays a game, deployed to the cloud on Fly.io, with a web dashboard for monitoring and a database persisting run logs and lifetime statistics.
- Developed the Python automation bot and deployed it as a cloud-hosted service on Fly.io, designed the database schema for logs and aggregate stats, and built the Netlify-hosted dashboard surfacing real-time and lifetime metrics.

Idle Riches — Mobile Game (Flutter)

Google Play — closed testing

- Designed and developed a complete idle game featuring custom animations, level design, progression systems, and user authentication.
- Built with Flutter and the Flame game engine, backed by Supabase for authentication and persistence; implemented the game loop, state management, and save/sync logic.

PROFESSIONAL EXPERIENCE

Puttshack

Feb 2022 – Present

Senior Front End Web Developer

FL

- Led a full redesign of the primary website using micro-frontend architecture, delivering a scalable, maintainable system that empowered the marketing team to manage content and launch new features independently.
- Built reusable, component-driven React controls (form validation, navigation, dropdowns, tabbed views, carousels) used across web and React Native mobile apps, ensuring a responsive UI across devices.
- Developed W3C-standards-compliant interfaces with React, TypeScript, HTML5, CSS3, modular LESS, and Bootstrap; optimized builds with Webpack and Babel.
- Integrated RESTful web services and managed application state with Redux and redux-thunk; implemented a Node.js service to handle authentication.
- Integrated Quasar into a Vue 3 project to extend functionality and unify styling, and reviewed pull requests with a focus on code quality and maintainability.

Relevnt

Jul 2021 – Mar 2022

Front End Developer

FL

- Built and shipped React and React Native screens for a mobile-first product, bundled with Vite for faster development builds.
- Developed reusable UI components and forms with React, HTML, CSS, and modular LESS, ensuring responsive layouts across devices.
- Integrated RESTful APIs over AJAX/JSON, managed state with Redux, and implemented a Node.js authentication server.
- Wrote unit tests with Jest and React Testing Library to safeguard core components.

Epsilon

Feb 2019 – Jul 2021

Front End Developer

FL

- Developed web application UIs with React, Redux, HTML5, CSS3, and Bootstrap, integrating RESTful services over AJAX.
- Implemented real-time updates using WebSockets to keep candidate information in sync across clients.
- Built reusable components and converted design mock-ups into standards-compliant, responsive pages.
- Used Node.js for server-side authentication and supporting services within the application stack.

BNY Mellon

Jun 2018 – Jan 2019

Front End Developer

FL

- Built a single-page application with React and React Router that consumed RESTful web services.
- Managed application state with Redux and added redux-thunk middleware to dispatch resolved data from promise-based actions.
- Used Axios to fetch and persist data, rendering results as tables and charts; implemented MongoDB-backed storage and application routing.
- Built responsive, mobile-friendly layouts with the Bootstrap grid and CSS media queries; wrote Jest unit tests; collaborated with the backend team on API contracts in an Agile/JIRA environment using Git.

EDUCATION

Lambda School (now BloomTech)

2021

Software Development
